

Pain Management

Pain management is essential because, even when the underlying disease process is stable, uncontrolled pain prevents patients from working productively, enjoying recreation, or taking pleasure in their usual roles in the family and society. Chronic pain may have many causes and factors, therefore can be much more difficult to control than acute pain. It will require a multidisciplinary approach and customized treatment protocols to meet the specific needs of each patient.

Topical and transdermal creams and gels can be formulated to provide high local concentrations at the site of the application, for trigger point application or in a base that will allow systemic absorption. Side effects associated with oral administration can often be avoided when medications are used topically.

We work together with you, and your physician to customize the medication to meet each patient's specific criteria. We prepare unique medications not commercially available which will best meet your special needs.
